

## Spooofcheck™

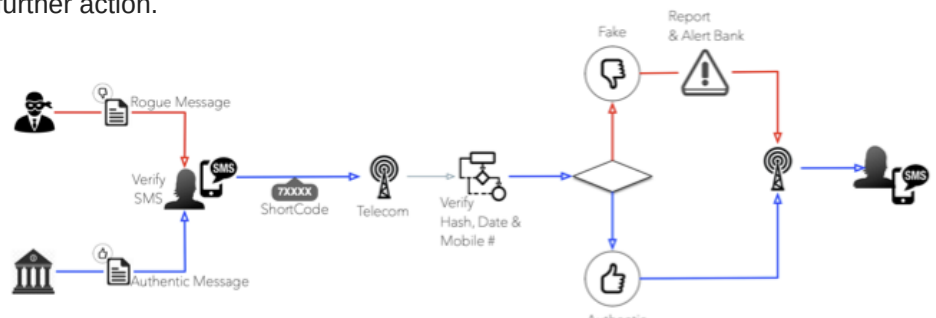

With the ever increasing threat of SMS-initiated spoofing and phishing activities, Banks, Government Agencies, and reputable Enterprises need a reliable way to counter these threats. Introducing Spooofcheck, HelloTech's proprietary feature to counter these threats.

### How does Spooofcheck work?

Spooofcheck automatically adds extra hash characters at the end of your message to allow for authenticity verification. Recipients then forward the original SMS to a verification Shortcode e.g. 76060 to get an immediate reply.

The recipient would then receive a confirmation of the authenticity of the original SMS or an alert of a fraudulent message. A report can then be generated to the Telco and the organisation to alert them of the spoof or phishing attempt for further action.

Result : dramatically lower exposure to spoofing and phishing, increased confidence in the enterprise and brand, reduced losses to fraud.

Contact HelloTech today to see how you can reliably protect your customers and your brand.

## Robust | Secure | Reliable
